Most building construction in Romania is based on steel. Romanian steel is generally imported and consumed by the construction industry. In Romania there are large amounts of materials used in the construction of new buildings, such as steel, cement, sand, gravel, asphalt and masonry. Most buildings are built using reinforced concrete, but some residential buildings use masonry to form their facade. Romanian construction materials are generally of high quality and the main problem is with the high energy price. In 2015, it was estimated that Romania spent US\$6.44 billion on construction materials and services. See also Economy of Romania References RomaniaInhaler dosing instruments and combinations thereof that can be used by a patient to discharge doses of medicament into a patient's airways are well known. Such dosing instruments comprise an inhalation actuator and one or more inhalation chambers. The patient activates the inhalation actuator to generate an inhalation event which causes

an aerosolized dose of medicament to be delivered to the patient's airways. The inhalation chamber(s) are configured to hold the medicament dose and release the dose into the patient's airways in response to the patient's inhalation event. Some inhalation instruments have a combined dosing/air-tight compartment. Examples of such devices are illustrated in U.S. Pat. Nos. 5,927,862 and 6,581,581. In certain devices such as the devices disclosed in U.S. Pat. Nos. 5,927,862 and 6,581,581, the doses of medicament are stored in compartments of the inhalation chamber which are coupled to a pressurization mechanism. In some devices, such as the devices illustrated in U.S. Pat. Nos. 5,927,862 and 6,581,581, the compartments which are coupled to the pressurization mechanism are configured to be selectively pressurized and depressurized in response to the patient's inhalation event. In these devices, the medicament doses are stored in a chamber of the inhalation chamber which is not coupled to the pressurization mechanism. In the case of such devices, the pressurization mechanism can be activated to pressurize the medicament dose which is stored in the inhalation chamber, which pressurization is then released by the pressurization mechanism in response to the patient's inhalation event.
